

LiveRadar

v3.1.1

One-page repo summary based on README.md, package.json, vite.config.js, src/main.js, src/core/*, src/api/*, and src/features/*.

What It Is

LiveRadar is a browser-based dashboard for monitoring livestream status across Douyu, Bilibili, Twitch, and Kick. It centralizes room checks, live or offline state, alerts, and locally stored room lists.

Who It Is For

Explicit persona label: Not found in repo. Inferred primary user from the feature set: people tracking favorite streamers across multiple platforms from one browser tab.

What It Does

- Monitor Douyu, Bilibili, Twitch, and Kick rooms or channels in one list.
- Refresh statuses manually or with configurable auto-refresh and concurrent request pooling.
- Show per-room cards with owner, title, cover or avatar, viewer or heat data, and live or replay state.
- Send browser notifications, plus favorite-streamer audio alerts, when streams go live.
- Add, remove, and favorite rooms; keep search history; and persist preferences and cache in localStorage.
- Import or export monitored rooms as JSON and adjust request strategy through region and proxy logic.

How It Works

- src/main.js loads styles and config, runs performance checks, sets global error handlers, and calls initializeApp().
- core/bootstrap.js wires state, DOM cache, event routing, renderer, refresh manager, status fetcher, and feature modules.
- Refresh flow: UI and event bus -> refresh-manager.js -> status-fetcher.js -> platform-adaptor.js and platform-sniffers.js.
- Network flow: direct fetch where possible, otherwise api/proxy-manager.js applies failover proxy selection and tracking.
- state.js stores rooms, cache, proxy stats, and preferences in localStorage; renderer, notifications, ticker, and audio read the updated cache.
- Dedicated backend or database service: Not found in repo.

How to Run

1. Install Node.js 20.19+.
2. From the repo root, run npm install.
3. Start the dev server with npm run dev.
4. Open <http://localhost:3000> (set in vite.config.js).
